Abstract

Background: Guda is the terminal part of the large intestine. Guda is a passage through which excretes the flatus and faeces. It is one of the Bahirmukh Srotas, Pancha Karmendriyas, Dashpranayatanas and also Muladhara Chakra which is placed in the pelvic region. Guda is characterized as Moola of Purishvaha Srotas and is also related to Annavaha Srotas. Aim: To elaborate literary review of Guda Pradesh with the correlation of anatomical significance described in Ayurveda to contemporary science. Discussion: Acharya Charak mentioned the Guda in one of 15 Koshthhangas. He considers two parts that are Uttar Guda and Adhar Guda. Embryologically it is obtained from Matrij Bhava. The total length of the Guda is 4 and ½ Angulas. There are three Valies named Pravahini, Visarjani and Samvarani which present inside the Guda at a distance of one and half Angulas from each. Guda is related to Purishdhara Kala. Acharya Sushruta mentioned the Guda as a Marma and considered it as Sadhyapranahara Marma. The diseases related to Guda are Arsha, Bhagandara, Parikartika, Nadivrana, Gudabhramsha, Sanniruddha Guda, Gudavidradhi etc. Guda is one of the Sthana of Apana Vata, and the best Chikitsa of Vata is Basti karma. Basti is administered through the Guda. Conclusion: In this regard, it is concluded that knowledge of Guda as described in Charak Samhita, Sushruta Samhita, and Ashtanga Hridayam is scattered from here, and it is very helpful for understanding the anatomical positions, diseases and pathogenesis as well as treatment.

Keywords: Adhar Guda, Guda, Guda Marma, Guda Vali, Purishvaha Srotas, Uttar Guda

1. Introduction

Ayurveda is the Upveda of Atharvaveda and is one of the oldest holistic medical systems in the world. The main aim of Ayurveda is to protect the health of Swastha (healthy person) and cure the Atura (patients) from the disease. In Ayurveda, Sharir is divided into six parts that are 4 Shakha (extremities), Madhyam (trunk or Koshthha), and Shira (head and neck).

Discussion about the anatomical details of *Guda* like- embryological development, *Nirukti*, blood supply, function, modern review, applied aspects, and management, etc. are scattered in classical *Ayurvedic Samhitas*.

2. Aim and Objective

To elaborate the literary review of *Guda Pradesh* (anorectal region) with the correlation of anatomical significance

Article Received on: 16.02.2024 Revised on: 10.04.2024 Accepted on: 27.03.2024

^{*}Author for correspondence

described in the literature of *Ayurveda* and as well as contemporary science.

3. Method

References and data about *Guda Pradesh* are collected from various *Ayurvedic* textbooks and modern texts. From *Brihatrayi*, previous work done related to *Guda* along with a detailed study of *Ayurveda* as well as modern on the topic was reviewed and relevant information was collected.

4. Discussion

4.1 Anatomy of Guda

4.1.1 Vyutpatti (Gu + da)

Gu = Mala or Vishthha and Da = To give, the overall meaning is that, the organ which gives Mala /faeces¹.

4.1.2 Nirukti

In Ayurvedic Shabda Kosha "Guda is the organ which evacuates Apana Vayu".

4.1.3 Synonym

Parashar Samhita - Apana, Guda, Payu, Braghana

Charak - Uttar Guda, Adhar Guda, Sthula

Guda

Sushruta - Gudamandala, Gudavalaya,

Payuvalaya, Gudoshta

Vagbhatta - Gudamarga Dalhana - Gudantram Amarkosh - Apanam Vijayrakshita - Apanah

4.1.4 The Embryological Aspect of Guda

Embryologically it is developed by *Matrij Bhava* (maternal source)². *Antra*, *Guda* and *Basti* are formed from the essence (*Prasad Bhag*) of *Rakta*, and *Kapha* is digested by *Pitta* along with the help of *Vayu*³. Acharya Bhadra Shonak hypothesized in a conference which is coated in *Charak Sharir Sthana* that *Pakvashaya* and *Guda* are those organs which are developed at the very first stage in the foetus. Whereas *Acharya Atreya* disproves his hypothesis and explains the ultimate opinion of lord *Dhanwantri* that all organs developed simultaneously from the beginning⁴.

4.1.5 Measurement of Guda

Acharya Sushruta and Vagbhatta mentioned the total length of Guda is 4 and ½ Angulas⁵. The Parimana of Guda is Atmpanitala (palm of hand) which is described by Acharya Vagbhatta⁶. Acharya Dalhana recognized one Angula is the maximum width of a thumb⁷, which is practically equal to 2 cm. Therefore, all over the length of Guda is 4.5 Angulas or 9 cm, and the total length of the rectosigmoid junction to the anal verge is 16.5 cm.

4.2 Location (Sthana)

Acharya Sushruta mentioned that Guda is attached to Sthulantra (large intestine)⁸. Normal functions of excretion of flatus and faeces are performed by Apana Vayu. When it deviates produces Basti and Guda-related diseases⁹.

4.3 Swaroop

Guda seems like *Shankha Nabhi* (conch shell) having many spirals in shape, may be correlated with anteroposterior and lateral curvatures of the rectum and anal canal⁸.

4.4 Parts of Guda

Acharya Charak described the Uttar Guda and Adhar Guda among the 15 Koshthhangas and Gudoshthha¹⁰. Acharya Chakrapani explained that Uttar Guda (distal Rectum) is a faecal reservoir and Adhar Guda (anal canal) is through which faeces is excreted¹¹. As in modern, above the middle Houston valve of the rectum act as a reservoir of faeces, and can be correlated with Uttar Guda (distal rectum) and below the middle Houston, the valve helps

Table 1. Part of *Guda* with its modern correlation

S.No	Parts of Guda	Modern terminology
1	Uttar Guda	The upper part of the rectum and sigmoid colon or Distal Rectum
2	Adhar Guda	The lower part of the rectum and anal canal
3	Gudoshthha	Anal orifice

Table 2. Guda Vali with its modern correlation

S.No	Guda Vali	Situation	Modern terminology
1	Pravahini	Proximal	Middle Houston valve
2	Visarjani	Middle	Inferior Houston valve
3	Samvarani	Distal	Dentate line

in defecation, can be correlated with Adhar Guda (anal canal).

4.5 Description of *Vali*

On the lateral walls of the interior aspect of Guda, there are lateral folds, arranged in a spiral way like a palate of an elephant. Each Vali is situated at a distance of 1 and ½ Angula from the hair margin. Gudoshthha (anal orifice) is situated at a distance of half Yava (half-finger) in length and first Vali present at a distance of one Angula from the anal orifice. These three Valies are called Pravahini, Visarjani and Samvarani¹².

Acharya Vagbhatta considered the same description as Acharya Sushruta and specified that the distal-most Vali Samvarani is present in one Angula distance from Visarjani¹³.

4.6 The Structure Involved in Guda **Anatomy**

Asthi- In Guda Pradesh, there are five Asthi which form the Sroni are- Guda, Bhaga, Trika, and two Nitamba Asthi14. Three Sandhi which is Samudga type related to Guda¹⁵. Three Peshi in the Guda¹⁶. And one Seveni present in the relation of Guda¹⁷.

4.7 Vasculature of Guda

There are 700 Siras in the body which is mentioned by Acharya Sushruta. There are 34 Siras present in Koshtha and 8 out of 34 Siras of Koshtha supply the Guda, Medhra and Shroni¹⁸.

There are 10 Adhogami Dhamanies which carry Apana Vata, Mutra, Shukra and Artava to their respective organ. Two Dhamani out of them carry the function of defecation¹⁹.

4.8 Guda in Various Contexts

4.8.1 Guda as Koshthhanga

Acharya Charak considered Guda in terms of Uttar Guda and Adhar Guda as under 15 Koshthhangas²⁰.

4.8.2 Guda as Marma

Acharya Sushruta mentioned Gudaas a Marma in under Udargat Marma and also considered in Sadyapranahara Marma as Agni Mahabhuta dominant here²¹.

Acharya Vagbhatta mentioned Guda Marma under Dhamani Marma²². It is a one in number and if there is injury, sudden death occurs.

4.8.3 Guda as Srotas

Acharya Charak considered Sthula Guda as one of the Moola of Purishvaha Srotas²³. Acharya Sushruta has used the term Guda as one of the roots of Purishvaha Srotas²⁴.

4.8.4 Guda as Karmendriya

Acharya Charak described the Guda as under one of Pancha Karmendriyas and its function is Visarga²⁵.

4.8.5 Guda as in Muladhara Chakra

Muladhara Chakra (inferior hypogastric plexus) presents near Guda and genitalia.

4.8.6 Guda as Pranayatana

Acharya Charak considered the Guda to be one of among Dashpranayatanas²⁶.

4.8.7 Guda as Vata Sthanam

Acharya Sushruta considered that Vata Sthana (location) is Shroni (pelvic region) and Guda²⁷.

4.8.8 As Basti Chikitsa

Acharya Arundutta, the commentator of Ashtanga Hridayam mentioned that Basti (Niruha and Anuvasana) is the best Chikitsa (treatment) of Vata which is administered in Guda²⁸.

4.9 Anatomical Relations

According to Acharya Sushruta, Basti (urinary bladder), Basti sira (head of bladder and fundus), Paurush (prostate gland), Vrishan (testicles) and Guda (ano-rectum) are interrelated and situated inside the cavity of pelvis²⁹.

Acharya Sushruta commanded in the context of the operation of the Ashmari (vesicle calculus) that the surgeon should place his finger into the Guda and stabilize the Ashmari to make a prominence in the perianal region, which denotes that Guda is located very closely posterior to Basti³⁰.

5. Modern Review³¹

Embryologically rectum has two developmental parts, the upper part related to the peritoneum develops from the hindgut and lies above the third transverse fold of the rectum. The lower part devoid of peritoneum develops from the cloaca and lies below the third transverse fold. The upper 15 mm of the anal canal develops from the primitive anorectal canal, and the lower part below the pectinate line (lower 15 + 8 mm) is formed from proctodaeum. Non-continuity of the two parts results imperforates anus.

Anorectum is 15 to 16 cm long and Its extension is from the recto-sigmoidal junction to the anal orifice. All over the length of the rectum is 12 cm and the anal canal is 3.8 cm. The rectum is a continuation of the sigmoid colon and ends in the anorectal ring. Whereas the anal canal extends from anorectal junction to anal orifice. The anal orifice is a part where hair, skin and conjoint longitudinal muscle are present. The rectum, in the upper part, has the same diameter of 4 cm as that of the sigmoid colon, but in the lower part, it is dilated from the rectal ampulla. The muscular layer of the rectum and anal canal is an inner circular and outer longitudinal layer. The mucus membrane of an empty rectum shows two types of foldslongitudinal and transverse. The longitudinal folds are transitory. They are present in the lower part of an empty

rectum and are obliterated by distension. The transverse or horizontal folds of Houston's valves are permanent and most marked when the rectum is distended. These are superior, middle and inferior transverse or Houston's valves.

The anal canal is divided into three parts- the upper part is about 15 mm, the middle part is about 15 mm, and the lower part about 8 mm long. The upper part contains 6 to 10 anal columns, anal valves, and an anal sinus. The middle part or pecten contains a transitional zone, the white line of Hilton. Lower cutaneous part lined by true skin containing sebaceous glands, and sweat glands.

The internal anal sphincter is involuntary. It is formed by the thickened circular muscle coat of this part of the gut. It surrounds from the upper end of the canal to the white line of Hiltons. This sphincter is innervated by the autonomic nerve. The external anal sphincter is under voluntary control. It is made up of a striated muscle and is supplied by the inferior rectal nerve and the perineal branch of the 4th sacral nerve. It surrounds the whole length of the anal canal and has three parts-subcutaneous, superficial and deep.

5.1 Conjoint Longitudinal Coat

It is formed by the fusion of the puborectalis with the longitudinal muscle coat of the rectum at the anorectal

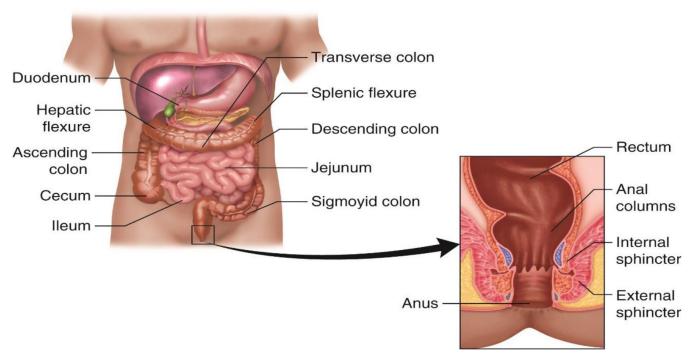

Figure 1. Rectum and anal canal. https://anatomytool.org/sites/default/files/Unit%209%20D_M4_30.jpg

junction. It lies between the external and internal sphincters.

5.2 Anorectal Ring

This is a muscular ring present at the anorectal junction. It is formed by the fusion of the puborectalis, the uppermost fibres of the external sphincter and the internal sphincter. It is easily felt by a finger in the anal canal. The surgical division of this ring results in rectal incontinence.

5.3 Pelvic Floor Muscle

The pelvic floor or pelvic diaphragm is composed of the muscle fibre of the levator ani, the coccygeus. This muscle

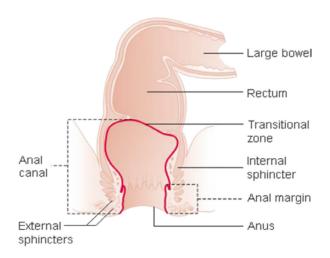

Figure 2. Anal sphincters. https://upload.wikimedia.org/wikipedia/commons/5/52/ Diagram_showing_the_anatomy_of_the_anus_ CRUK_282.svg

supports to sphincteric mechanism in the anal canal, the opening of the anal canal and strengthens the anorectal angle during defecation³¹.

6. Physiological Concept of Guda

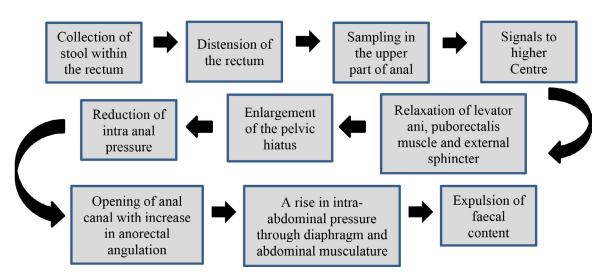

Guda is considered one of the Pancha Karmendriyas and its function is to excrete the faeces/ Mala from the body³². The act of defecation and maintaining continence is accomplished with the help of Apana Vayu and the three Valies. Arundatta and Gannatha Sen described that the proximal Vali is Pravahini which helps in straining and pushing the stool downwards. The Madhyama Vali is Visarjani which allows the stool to evacuate from the body and Samvarani which expels the stool out of the body plays voluntary control and immediately constrict the anus³³.

7. Defecation³⁴

The act of defecation is preceded by a wave of peristaltic which passage down the descending and pelvic parts of the colon. The rectum becomes distended by the entry of faeces, which gives rise to the desire to defecate.

7.1 Sequential Steps in Faeces Evacuation³⁴

Scheme 1

8. The Pathological Aspect of Guda

In the context of Ayurvedic literature, the term "Guda" denotes both the anal canal and rectum which according to Modern Medical Science is indicated by the united term of ano - rectum. The description of various diseases related to the anorectal region is found in the Ayurvedic texts. These are Arsha (Hemorrhoids), Parikartika (Fissure in ano), Bhagandara (Fistula in ano), Gudabhramsha (Rectal Prolapse), Sanniruddha Guda (Anorectal Stenosis), Nadivrana (Sinus), Guda Vidradhi (Anal abscess) etc. There are reasons behind anorectal disorders like constipation, indigestion, improper diet, stress, reduced digestive fire (Mandaagni), lack of exercise, faulty lifestyle, improper toilet training, spicy food, intake of excess meat etc.

9. Management

Anorectal disorders are the horrent problem of our society today. Acharyas mentioned that the root cause of all diseases is "Mithya Ahara - Vihar and Mandaagni", so for prevention of anorectal disorders, one should take proper diet and follow the Dincharya, Ritucharya, Ratricharya, and Sadvritta. Also, Yogic practice should be used for the management of anorectal disorders like- Mula Bandha, Uddiyan Bandha, Markataasana, Uttanpada asana, Bhujanga asana, Sarvanga Asana etc. Mula Bandha and other Asanas stimulate the digestion, and pelvic nerves, relieving constipation, and indigestion and strengthening pelvic floor muscles.

Basti administered through Guda and normalized Apana Vayu leading to Vatanulomana and improving the physiological function of Vata. By the use of Basti Karma, we can manage our hectic lifestyle and make it a healthy life³⁵.

10. Conclusion

This review is of strong impression that *Guda*, as described in *Sushruta Samhita*, may be correlated with anorectal region description of the modern literature while the subdivisions of the *Guda* by *Acharya Charak* viz. *Adhar Guda* can be correlated with the lower part of the rectum and anal canal and *Uttar Guda* can be correlated with the distal rectum. In *Ayurveda*, *Guda* is

given great importance which is evident from the fact that the *Guda* is described concerning *Marma*, *Srotas*, *Koshthhanga*, *Karmendriya*, *Pranayatana*, *Vata Sthan*, *Muladhara Chakra*, and in *Basti Chikitsa*. Till date, most of the research and clinical application of *Guda* is focused on diseases of *Guda* as *Bhagandar*, *Arsha*, *Parikartika and Basti Chikitsa* while the other applied aspects of *Guda* as *Marma*, *Srotas*, as *Muladhara Chakra*, *Vata Sthan*, are yet to be explored. This review highlights the *Ayurveda* perspective of *Guda* and unexplored concepts related to *Guda*. There is an immense need for research in the applied aspects of *Guda* as *Marma*, *Srotas*, *Muladhara Chakra*, *and Vata Sthan*.
